## Injection technique for concrete

The expansion-free anchoring for the professional user.

## OVERVIEW

Threaded rod
FIS A,
zinc-plated steel

Threaded rod FIS A,
stainless steel of the corrosion resistance class III

Approved in conjunction with FIS V/FIS VS/FIS VW:

- Concrete $\geqq \mathrm{C} 20 / 25$ and § C50/60

## Suitable in conjunction

 with FIS VS and FIS EM:- Concrete $\geqq$ C12/15

## For fixing of:

- Steel constructions in general
- Railings
- Suppor ts
- Window elements
- Rails
- Scaff olds
- High-r acks
- Machines
- Consoles

## DESCRIPTION

- Specially for use with Injection mortars FIS V, FIS VS, FIS VW or FIS VT in non-cracked concrete.
- The anchor rods are also suitable for push-through installation, using special push-through elements.
- The mortar bonds the entire surface of the anchor rod to the wall of the drilled hole and largely seals the hole.
- Anchor rod made of stainless steel of the corrosion resistance class III e.g. A4 for outdoor use and in damp conditions.

## Advantages/Benefits

- High-performance mortars allow high loads in non-cracked concrete.
- Various setting depths for different load levels and useful lengths.
- Quick manual installation without a setting tool reduces the work involved.

- Simple and quick push-through installation reduces installation time.
- Steel grade 5.8 or A4-70 guarantee the highest steel load-bearing strength and maximum permissible bending moments.

## INSTALLATION

## Type of installation

- Pre-positioned installation
- Push-through installation (with fischer push-through element)

## Installation tips

- Drill the hole. Observe the desired setting depth / usable length.
- Clean the drill-hole thoroughly
( blow out $4 x$, brush out $4 x$, blow out $4 x$ ) $\geqq 18 \mathrm{~mm}$ with compressed air.
- Fill with the defined mortar quantity from the bottom of the drill-hole.
- If necessary screw the push-through element into position up to the depth marking.
- Then press the threaded rod down to the bottom of the hole (without setting tool), turning it slightly while doing so.

## Pre-positioned installation

Push-through installation

- Bear in mind the curing time of the injection mortar.
- Install the building component. Observe the installation torque indicated in the technical data sheet. Brushes BS see page 84.

* Steel failure
" For minimum spacing and minimum edge distance the above described loads have to be reduced (see "fischer Technical Handbook" or "fischer Design software COMPUFIX").
Values given above are valid under the following assumptions: - Sufficient mechanical cleaning of the drill hole using stainless steel brushes.
Dry concrete, temperature range $50^{\circ} \mathrm{C}$ long term temperature and $80^{\circ} \mathrm{C}$ short term temperature.
All values apply for concrete C $20 / 25$ without edge or spacing influences
Design resistant loads: material safety factor $\gamma_{M}$ is included. Material safety factor $\gamma_{M}$ depends on the type of anchor.
Recommended loads: material safety factor $\gamma_{M}$ and safety factor for load $\gamma_{L}=1.4$ are included.
The condition of application differ from those given in the European Technical Approval (ETA). For further detailed information about the ETA please contact the fischer technical service department. RG M threaded rods can be used as an alternative. Please refer to page $\mathbf{5 3}$ for suitable threaded rods.
